

Formax™

Premium Vitamins/Minerals

The Perfect Solution!

Want Hi-Mag/Grass Tetany Protection?

Grazing: Bronze M14
Grazing Silver M14
Grazing Gold M14

Want to Increase Reproduction Efficiency?

Breeder Bronze
Breeder Silver
Breeder Gold

Want Fly Control?

Fly Control Rabon & CTC
Fly Control IGR
Fly Control Breeder IGR

Want More Weight Gain?

Medicated Bovatec

Want One Mineral for Year-Round Supplementation?

24/7

Want Bacteria Treatment?

Medicated CTC

Formax™

THE FORMAX™ ADVANTAGE

Formax™ mineral and vitamin supplements are formulated by Alabama Farmers Cooperative specifically for southeastern livestock consuming southeastern forages. Forages in the Southeast are unique in their nutrient composition. Therefore, a mineral and vitamin program formulated for southeastern forages will better meet the unique needs of your livestock. Formax™ offers a full line of breeding, grazing and medicated minerals for cattle along with horses and goats as well. When using Formax™ products, you can be assured of a product formulated and manufactured in a way to provide a palatable, consistent product at an economical price to meet and exceed the daily needs of your livestock.

Xtra Dry

Formax™ minerals contain the added benefit of Xtra Dry, a free-flowing powder added at the mixing stage. It improves the quality of free-choice minerals where weather-resistance and anti-caking is desired. Xtra Dry will reduce caking, improve flow-ability, repel moisture, reduce leaching of nutrients and help minerals to remain free flowing without affecting palatability or mineral consumption.

Value of Mintrex® Chelated Trace Minerals

Mintrex® chelated trace minerals from Novus International, Inc., provide cattle with a more highly bioavailable source of trace minerals. This increase in bioavailability comes from the unique technology called chelation. Chelated trace minerals are chemically bound to a ligand (or carrier) that helps improve the bioavailability of the mineral. This unique bond creates a stable complex in the upper GI tract of the animal that helps reduce losses due to antagonisms, allowing efficient utilization by the animal. MINTREX® utilizes the amino acid methionine to chelate the trace minerals. Methionine is a limiting essential amino acid that cannot be made by the animal naturally. As a result, when high-forage diets are being used, methionine is the first limiting amino acid. Amino acids have a very important role during the gestation and lactation phases of an animal's life cycle.

Mineral and Vitamin Basics

Essential Minerals:

- **MACRO Minerals** - Calcium, Phosphorous, Magnesium, Potassium, Salt and Sulfur
 - o Required for: Milk Production, Muscle and Bone Development, and Reproduction
- **MICRO Minerals** - Cobalt, Copper, Iodine, Iron, Manganese, Molybdenum, Selenium and Zinc
 - o Required for: Immunity, Reproduction, Enzyme Activity, Bone and Skin Development, and Blood Cell Formation
- **Vitamins** - A, D and E
 - o Required for: Increased Immune Response, Reduce Effects of Stress, Growth and Reproduction Efficiency

Mineral and Vitamin Management

Formax™ Minerals should be provided free choice at all times. Provide one mineral feeder per 25 animals. Feeders should be located near water tanks, loafing areas and areas of best grazing. Depending on size of animal, consumption should average 4 ounces per head per day over a feeding period.
