Process Adjustments at High Altitudes

ALTITUDE CHART		
<i>For Boiling Water Processing</i>		
	<u>Altitude Feet</u>	<u>Increase Processing Time</u>
If you are preserving at an altitude higher than 1,000 feet above sea level, adjust boiling water processing time as indicated.	1,001–3,000	5 minutes
	3,001–6,000	10 minutes
	6,001–8,000	15 minutes
	8,001–10,000	20 minutes

ALTITUDE CHART			
<i>For Pressure Canning</i>			
	<u>Altitude Feet</u>	<u>Weighted Gauge</u>	<u>Dial Gauge</u>
If you are preserving at an altitude higher than 1,000 feet above sea level, adjust pressure pounds as indicated.	0 – 1,000	10	11
	1,001–2,000	15	11
	2,001–4,000	15	12
	4,001–6,000	15	13
	6,001–8,000	15	14
	8,001–10,000	15	15

Using the process for canning food at sea level may result in spoilage if you live at altitudes of 1,000 feet or more. Water boils at lower temperatures as altitude increases. Lower boiling temperatures are less effective for killing bacteria. Increasing the process time or canner pressure compensates for lower boiling temperatures. Therefore, when you use the guides, select the proper processing time or canner pressure for the altitude where you live. If you do not know the altitude, contact your local county Extension Agent. An alternative source of information would be the local district conservationist with the Soil Conservation Service.

Controlling Headspace

The unfilled space above the food in a jar and below its lid is termed headspace. Directions for canning specify leaving 1/4-inch for jams and jellies, 1/2-inch for fruits and tomatoes to be processed in boiling water, and from 1- to 1 1/4-inches in low acid foods to be processed in a pressure canner.

This space is needed for expansion of food as jars are processed, and for forming vacuums in cooled jars. The extent of expansion is determined by the air content in the food and by the processing temperature. Air expands greatly when heated to high temperatures; the higher the temperature, the greater the expansion. Foods expand less than air when heated.
